                                                                                                                                                                                                                                                                                                                               alkylating agents. The mutation affects the catalytic properties of the enzyme but does not affect their binding properties. The invention provides for new ligands for use in SPA which have increased binding affinity for a tyrosine phosphatase or cysteine protease. The ligands contain at least two 4-phosphono(difluoromethyl) phenylalanine groups which increase binding affinity of the ligand to its respective enzyme. The assay can be used to determine the ability of new ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzyme binding assay for detection of useful compounds - use form of wild-type enzyme, in which serine replaces cysteine active site, to reduce interference from oxidising/alkylatir
                                                                                                                                                                                                                                                         compound mixtures to competitively bind with an enzyme. The method is claimed to allow a better usage of SPA in the discovery of compounds the treatment and study of diseases, e.g. diabetes, cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  using mutated proteases and phosphatases whereby the catalytic cysteine residue of the enzymes are replaced with a serine or alanine residue to correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the problem of interference in SPA from extraneous oxidising and correct the correct the correct the correct the correct that the correct the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention claims for a method for use in a scintillation binding assay (SPA) for proteases and phosphatases. The method to use in a scintillation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a mutated human apopain (caspase-3) C163S pro-enzyme. The active enzyme containing P17 subunit (Ser29-Asp175) and P12 subunit (Ser176-His277) was engineered for expression using the MetSer29-Asp175 and MetSer176-His277 constructs. The invention claims for a method for use in a scintillation proximit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Pages 39-40; 63pp; English.

The present sequence represents a mutated human apopain (caspase-3) C163S pro-enzyme. The active enzyme containing P17 subunit (Ser29-Asp175) and P12 subunit (Ser176-His277) was engineered for expression using the MetSer29-Asp175 and MetSer176-His277 constructs. The invention provides a method for use in a scintillation proximity binding assay (SPA) for proteases and phosphatases. The method invol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant human apopain pro-enzyme; caspase-3 scintillation proximity binding assay; dia 4-phosphono(difluoromethyl) phenylalanine

The mutation affects the catalytic properties of the enzyme but does not affect their binding properties. The invention claims for new ligands for use in SPA which have increased binding affinity for a tyrosine phosphatase or cysteine procease. The ligands contain at least two 4-phosphono(difluoromethyl) phenylalanine groups which increase binding affinity of the ligand to its respective enzyme. The assay can be used to determine the ability of new ligands and compound mixtures to competitively bind with an enzyme. The method is claimed to allow a better usage of SPA in the discovery of compounds for the treatment and study of diseases, e.g. diabetes, cancer and
     Judgement of apoptosis-controlling activity for selecting drugs can be \mu sed for preventing and treating various diseases caused abnormality in apoptosis control -

Nrf2 is a caspase substrate. The method involves detecting cleavage of the Nrf2 protein by caspase in the presence of a candidate drug. Detection of cleavage of the Nrf2 protein by caspase in the presence of a candidate drug indicates apoptosis inducing activity. The method can be used for selecting a drug which can be used for the prevention and the treatment of various diseases caused by abnormality in apoptosis control, such as cancer. The

Such inhibitors can be used to treat Alzheimer's disease, amyotrophic lateral sclerosis (ALS), head trauma or other neurodegenerative disorders in humans (all claimed). Antibodies raised against the protease may be usef dor diagnosis of these disease states, or in their treatment.

The caspase 3 antisense oligonucleotides specifically hybridise with and inhibit the expression of caspase 3. Antisense compounds targeted to caspase 3 are useful to inhibit caspase 3 expression in cells or tissues and to modulate apoptosis. The caspase 3 antisense oligonucleotides are useful for treating disorders associated with expression of caspase 3. Such disorders include hyperproliferative disorders (e.g. cancer), viral infections (e.g. hepatitis), haematopoietic disorders, autoimmune disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's

-i- FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES
RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT
PROTECLYTICALLY CLEAVES POLYAGEN POLYMERASE (PARP) AT A
216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY
ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOP-
HELIX LEUCINE 2IPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN.
CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9 (BY SIMILARITY).

-i- SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT

Submitted (MAY-1997) to the EMBL/GenBank/DBBJ databases.

11 FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES

RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT PROTEDLYTICALLY CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 216-ASP-1-GLY-217 BOND. CLEAVES POLY(ADP-RIBOSE) POLYMERASE (PARP) AT A 215-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX'LOOP-HELIX LEUCINE ZIPPER DOMAIN AND THE MEMBRANE ATTACHMENT DOMAIN. CLEAVES AND ACTIVATES CASPASE-6, 77 AND -9 (BY SIMILARITY).

CLEAVES AND ACTIVATES CASPASE-6, 77 AND AN ALA, RELEASTING THE MATURE CYTOKINE WHICH IS INVOLVED IN A VARIETY OF INFLAMMATORY PROCESSES.

-1- SUBUNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT

                                                                                                                                                                                                                                 Submitted (MAR 2001) to the EMBL/GenBank/DDBJ databases.

11 FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES RESPONSIBLE FOR APOPTOSIS EXECUTION. CLEAVES AND ACTIVATES STEROL REGULATORY ELEMENT BINDING PROTEINS (SREBPS). OVEREXPRESSION PROMOTES PROGRAMMED CELL DEATH (BY SIMILARITY).

11 SUBUNIT: HETERODIMER OF A 20 kDa (P20) AND A 11 kDa (P11) SUBUNIT.

12 SUBCELULLAR LOCATION: Cytoplasmic.

13 SUBCELULLAR LOCATION: Cytoplasmic.

14 TISSUE SPECIFICITY: HIGHLY EXPRESSED IN HEART, LUNG, LIVER, AND KIDNEY. LOW LEVELS IN SPLEEN, SKELETAL MUSCLE, AND TESTIS. NO

BINDING TO THE ADAPTOR MCLECULE FADD RECRUITS IT TO EITHER RECEPTORS. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS FLICE/MACH PROTEOLYTIC ACTIVATION. THE ACTIVATE DOWNSTREAM APOPTOTIC PROTEASES. PROTEOLYTIC FRAGMENTS OF THE N-TERMINAL PROPEPTIDE (TERMED CAP3, CAP5 AND CAP6) ARE LIKELY RETAINED IN THE DISC. CLEAVES AND ACTIVATES DAVIS RESULTING CAP7. AND -10. MAY PARTICIPATE IN THE GRANZYME B APOPTOTIC PATHWAYS. PROTEOLYTICALLY CLEAVES POLY (ADP-RIBOSE) POLYMERSASE (PARP). HYDROLYZES THE SMALL-MOLECULE SUBSTRATE, AC- ASP-GLU-VAL-ASP-|-AMC. LIKELY TARGET FOR THE COWPOX VIBUS CRMA DEATH INHIBITORY PROTEIN.
                                                                                                                                                                                                                                                                                                           EMBL;
